Implementation

During the initial set-up and installation of the encoder, it is possible to set the direction of rotation and preset the encoder to zero.

Setting of Direction.

The connection designated "Direction" is used to set the direction of rotation. Notice, that the encoder must <u>not</u> be powered when the direction of rotation is set/changed. Notice also, that the encoder will change its position value when the direction of rotation is changed. Direction of rotation is viewed on the shaft end of the encoder.

Voltage Level on Input	Function
High: Vsup or Vsup/2 $\leq$ Vin $\leq$ Vsup	Encoder Increasing on Counter Clockwise Rotation
Low: Input not connected or 0V $\leq$ Vin $\leq$ Vsup/2	Encoder Increasing on Clockwise Rotation

Preset to Zero

The connection designated "Preset" is used to preset the encoder to zero. Notice, that the encoder must be powered when it is preset to zero.

Voltage Level on Input	Function
High: Vsup or Vsup/2 $\leq$ Vin $\leq$ Vsup	Encoder Value is set to Zero
Low: Input not connected or 0V $\leq$ Vin $\leq$ Vsup/2	Inactive

The encoder will be held at zero as long as the line is high, even though the shaft is turned. The line must be high for at least 100 mSec. for the preset to take effect. The new zero point will be stored permanently in the encoder.
